EDUCATION

University of British Columbia

Vancouver, BC

Bachelor of Applied Science, Engineering Physics

Sept. 2018 - Present

- Cumulative GPA: 4.00/4.33
- Projected Completion: December 2023

WORK EXPERIENCE

Teaching Assistant - Data Structures & Algorithms

September 2022 - Present

University of British Columbia

Vancouver, UBC

- Currently serving as a teaching assistant (TA) for CPSC 259 Data Structures and Algorithms for Electrical Engineers
- Oversee twice-weekly 30-student lab sessions, providing guidance and mentorship on assignments assessing the fundamentals of data structures and algorithms

Machine Learning Research Intern

June 2022 – August 2022

Menlo Park, CA

- SLAC National Accelerator Laboratory
 - Expanded an existing data analysis framework in **Python** to concurrently parse and perform principal component analysis (PCA) at **120 Hz** on a **4-megapixel** image data set
 - Explored existing solution landscape through a comprehensive literature review, correctly identifying incremental PCA (iPCA) as a method of promise
 - Identified rate-limiting steps through performance benchmarking, parallelizing iPCA using the MPI Message Passing Interface to achieve a 100x increase in update frequency

Software Developer Intern

January 2020 – December 2020

Validus Research, Inc.

Waterloo, ON

- Designed and expanded internal-facing web application in **Vue.js** to streamline analyst workflow, significantly reducing work overhead for the creation and maintenance of new and existing projects
- Developed UI and data pipeline allowing analysts to retrieve, format, and display analytics data from multiple sources, facilitating an intuitive comparison of varied client information
- Built **Flask API** in **Python** to allow for retrieval of relevant data from a **SQL** server, exporting formatted and cleaned project data to customized .xlsx file
- Returned after initial four month internship (January April) on a part time basis starting in July 2020

PROJECTS

Particle Simulation and Reconstruction | *Docker, Python, C*

September 2021 – May 2022

- Developed user-facing Python wrapper for Docker deployed C program used to generate simulated datasets of particles imaged through cryogenic electron microscopy, improving runtimes to adequately handle large workloads
- Implemented iterative refinement algorithm to reconstruct simulated 2D datasets into 3D particles, leveraging academic literature to benchmark performance
- Upheld best software development practices, including maintaining a rigorous test suite in **pytest** with minimum **90%** code coverage, to facilitate extensibility of open-source project repository

Autonomous Robot Control | Python, ROS, Deep Learning, Computer Vision

September 2020 – December 2020

- Using the ROS framework, developed a simulated robot in Python and C++ capable of autonomously navigating a
 competition surface
- Designed an image capture algorithm to reliably record the license plates of passing vehicles, subject to a SIFT keypoint match threshold
- Planned and implemented a convolutional neural network using **TensorFlow** and **Keras** to classify characters from license plate images, achieving **99%** classification accuracy on test dataset

TECHNICAL SKILLS

Languages: Python, JavaScript, HTML/CSS, Java, C/C++ **Technologies**: ReactJS, VueJS, Flask, JUnit, OpenCV, MPI, Git
